Task distribution and Contribution

For Task 1, an online meeting was held to discuss on the floor plan. The floor plan was draft during the meeting. Ru Qian and Yi Ya each drew one floor using Visual Paradigm, while Jie Ying and I worked on the description. I understand that drawing floor plan is more consuming than writing the description. However, it was difficult for us to share the floor plan and work on it together. I still remember feeling weird about the general-purpose lab at the first glance. Apparently, there are 60 workstations in each general-purpose lab! This experience taught us the importance of being meticulous in our work, and if we feel that something doesn't seem right, we should examine it. Our instincts can sometimes identify the mistakes!

For Task 2, we were required to come out with 10 questions. We distributed it to a combination of 3, 3, 2 and 2. I did questions 9 and 10. It was challenging to think of the 10 questions. We gather one afternoon and Jie Ying's room to complete the task. Yi Ya even created a small cursor parking at the bottom of the document, for us to park our cursor when we were not actively editing the document.

We discussed Task 3 at Family Mart, after our Network Communication Test. We headed out to Family Mart to try out the new ice cream flavour. Initially, we thought research shall be done on both end devices and networking devices. The initial task distribution is as follow:

- Router (Ru Qian)
- Switch (Jie Ying)
- Cables (Jie Ying)
- Wireless devices (Me)
- PC (Me)
- Projector (Yi Ya)
- Smart TV (Yi Ya)

We have almost completed the task only when we realised that we should include only LAN devices into account. The devices are curated and redistributed:

- Router (Ru Qian)
- Switch (Jie Ying)
- Cables (Jie Ying)
- Wireless Access Point (Yi Ya)
- Patch Panel (Yi Ya)
- Firewall (Me)

I worked on the firewall and completed the reflection questions there. However, I felt that I didn't contribute much to this task.

For Task 4, we discussed the placement of LAN devices together. This happened right after our second Network Communication Test. Since Ru Qian and Yi Ya did the floor plan previously, they proceeded to add routing devices and cables. Jie Ying handled the device arrangement using Cisco Packet Tracer, while I worked on the descriptions and calculated the required cables. While doing the calculations, I realised that the number of devices in Task 3 and Task 4 did not tally with the number of devices stated in Task 2, Question 10. However, it seemed to be too late to make changes. Hence, the changes were made in Task 6.

In Task 5, we distributed the work by assigning 2 to 3 rooms for subnet calculation. I started with the two General Purpose Labs and created a template for the others to follow. Interestingly, as I am writing

this report (which is now), and referring to the previous task, I realize we may have made an error in calculating the required IPs. After completing Lab 3, we learned that not only end devices need IP but also router interfaces. Therefore, I think we need to revise our subnet calculation.

Finally, for Task 6a, Jie Ying was in charge of the introduction and project background. I handled Tasks 1 to 3, since I was aware of the issues with Task 2, as mentioned earlier. Ru Qian managed Tasks 4 and 5, while Yi Ya worked on the conclusion.

How you work as a group?

We are already used to working with each other, and we know each other's working styles. Besides, we have an established way of distributing tasks. Usually, we divide the work to four segments. If there is no preference for a task, we spin the wheel to decide the people in charge.

After distributing the task, we collaborate on a shared Google folder. Each member works independently on their part, and we will review each other's parts and make comments and feedback when necessary.

What you have learned from working as a group?

I have learned that conflicts are inevitable in group work as everyone will have different picture in mind, even though we have agreed verbally on the same thing but there can still be misunderstandings. We need to learn to respect each other.

What you have learned from the project?

I have learned the basics of networking, the routing, networking devices selection and subnetting. Even though, we may be limited with our existing knowledge and made mistakes throughout the journey without realising it, this project laid a foundation for our understanding on networking. It also gave us the opportunity to experience the process of designing a network for a building.

Of course, there are some other lessons learned which are detailed in the reflection video.

Comments and suggestions on the project

I think the project is quite challenging due to the limitations of our knowledge. Thus, we need to spend more time on doing research. At the same time, I think this project can help us to understand more of the network that we are using today.
